

SSI-MU90

Fiber optic inertial measurement unit

SSI-MU90

Fiber optic inertial measurement unit

PRODUCTS FEATURES

- Output: RS-422
- Supply voltage: $\pm 5V \& \pm 15V$
- Operating temperature: -45~+65°C
- Product size: L90 X W90 X H90mm
- Weight: 980 \pm 20g

The SSI-MU90 series of fiber optic inertial measurement units consists of three fully solid-state closed-loop fiber optic gyroscopes, three highly stable quartz accelerometers and a data packing board. It is used to measure the angular velocity and linear acceleration of the carrier motion to provide information for the attitude and navigation control of the carrier, and the measurement results are output through the digital RS422 serial port. The hermetic design, strict process, and various compensations such as nonlinearity, quadrature, and temperature ensure that the fiber optic IMU can accurately provide the angular and linear motion parameters of the carrier under harsh environment, and is widely used in aviation, antenna stabilization platform, navigation and control of vehicles, dynamic measurement of ship attitude, mining, navigation control of small missiles and guided bombs, attitude measurement and control, etc. systems, etc.

3.2. RS422.

Baud rate: 921600bps;

Data output frequency: 4000Hz.

Data format: 1 start bit, 8 data bits, 1 even parity bit, 1 stop bit.

The first byte of frame header is 0x80, the second byte to the fourth byte is X gyro data, the fifth byte to the seventh byte is Y gyro data, the eighth byte to the tenth byte is Z gyro data. gyro data from byte 2 to byte 4, Y gyro data from byte 5 to byte 7, Z gyro data from byte 8 to byte 10; frame checksum in byte 11.
